INTEL TEACH TO THE FUTURE®
U.S. CLASSIC PROGRAM AND
U.S. EXPANSION PROGRAM
PARTICIPANT TEACHER
END OF TRAINING SURVEY
SUMMARY REPORT

PREPARED BY
NAOMI HUPERT
WENDY MARTIN
TOMOE KANAYA
INTRODUCTION

This report compares findings from the End of Training surveys administered to Participant Teachers (PTs) who took part in the Classic version of Intel Teach to the Future and who took part in the Expansion version of Intel Teach to the Future. Classic survey data were collected between March 2001 and July 2003. PT Expansion survey data were collected between April 2002 and March 2004. The comparison of data from these two surveys shows strong commonalities as well as differences between these two groups of teachers. In many cases the two groups were so similar that any differences were found to be not statistically significant. Unless otherwise noted, all of the findings presented in this report are statistically significant. It is important to bear in mind, however, that the formula for determining statistical significance is based in part on the size of the sample. Because the sample sizes for the data reported here are quite large, the reader should use caution when interpreting the meaning of statistically significant but otherwise small differences between the two groups. The frequencies for the Classic and Expansion PT End of Training survey data can be found in Appendix A.

METHODS

Subjects

All teachers who participated in the Classic or Expansion training were expected to complete an End of Training survey at the end of their training. In addition, all teachers participating in the Classic training were required to complete an application prior to the training experience. The total number of valid survey responses was 59,129, with 49,329 participants included in the Classic PT training and 9,800 participants included in the Expansion PT training, unless otherwise indicated. The substantial differences in sample sizes between the Expansion and Classic participants suggest that far fewer Expansion participants completed the End of Training surveys. It is important to keep these sample size discrepancies in mind while interpreting the comparisons between the results of these surveys. Pearson Chi-Square tests were used to determine the statistical significance of findings across both Participant Teacher groups.

No application data were collected for teachers participating in the Expansion Participant Teacher training until August 2003, and these demographic surveys were not administered in the same way that the End of Training surveys were administered. The PT demographic surveys were pop-up forms that appeared when participants clicked on the button to access the End of Training survey on the Intel Teach to the Future web site. Participant Teachers could choose to fill out, but were not required to do so. Because the information requested was optional, only small numbers of Expansion participants responded to the questions in this survey (N=2,367). Unlike the Master Teacher Expansion application data, the demographic data collected from Expansion PTs in this manner could not be linked to the End of Training surveys. Therefore, it is impossible to determine if the small group of teachers who completed the demographic surveys are included among or are representative of teachers who completed the End of Training survey.
Instruments

The survey was developed by CCT in consultation with ICT and Intel staff who had been involved in the development of the curriculum. Minor revisions were made to the survey in Spring 2001.

Procedures

Surveys were administered via the World Wide Web. Specifically, the surveys were mounted within an extranet maintained by Intel for Intel Teach to the Future participants. Classic participants were asked to complete the application prior to their participation. All teachers were asked to complete the End of Training survey at the conclusion of their training. The data reported here from the Classic Intel Teach to the Future training were collected between March 2001 and July 2003. The data reported here from the Expansion Intel Teach to the Future training were collected between April 2002 and March 2004.

FINDINGS

Participant demographics

While demographic data were collected from Classic participants through a required application form prior to participation in the training experience, Expansion participants were not required to complete an application and only limited demographic data from this population were collected. In August 2003, demographic data collection from Expansion participants began through the inclusion of an optional pop-up window that opened when participants clicked on the link to access the End of Training survey. Because of the issues described in the Methods section regarding the demographic data available on Expansion program PTs, this report does not present demographic data except for Table 1, which presents the percentage of participants’ schools serving students who are eligible for free or reduced lunch programs. Starting in April 2004, the Intel Teach to the Future team plans to begin including demographic questions in the End of Training survey for Expansion participants in order to address the issues raised above.

This report presents information regarding the poverty level of students at participants’ schools, as indicated by eligibility for free and reduced lunch programs, (see Table 1) because, though problematic, the data suggest that differences exist between the Classic and Expansion Participant Teacher populations, a distinction also found among Master Teachers (see Master Teacher Classic and Expansion Report). In each of these cases, participants in the Expansion trainings work in schools serving fewer disadvantaged students than those participating in Classic trainings: (30.5%) of Expansion teachers reported working in school where 0%-25% of the students were eligible for free or reduced lunch programs, while 28.5% of the Classic participants worked in such schools. However, unlike the Master Teacher population, a greater percentage of Participant Teachers in the Expansion population also worked in schools serving high numbers of disadvantaged students (23.5%) than did Classic Participant Teachers (22.1%). While this information is not highly reliable due to difficulties in collecting consistent data from Expansion training participants, it warrants further examination once additional data have been collected.

Description of the training experience

Both Classic and Expansion participants responded positively to questions about the training experience. However, when asked to describe their experience as a participant in the training, Expansion teachers generally rated their experience on several options at higher levels than did Classic participants. Expansion participants indicated that the training focused on technology integration into the curriculum, provided useful new ideas, showed effective uses of technology, and provided collaboration opportunities with others, and in each of these areas Expansion teachers rated their experiences at between 3% and 5% higher than did Classic teachers (see Table 2).

Teachers' expectations for classroom use of technology

When asked if the ideas and skills learned from the training would help them integrate technology into their classrooms, again, more Expansion participants (71.0%) indicated that the training would “definitely” help them than Classic participants (68.5%). In addition, 3.4% of Classic participants indicated that the training would “probably” or “definitely” not help them, and only 1.9% of Expansion participants indicated this (see Table 3).

Obstacles to technology integration

Participant teachers were asked about obstacles to the integration of technology into their teaching. Of the seven potential obstacles listed, both Classic and Expansion participants indicated that lack of technology access in their classroom was the most significant obstacle with 54.7% of Classic participants and 53.9% Expansion participants responding that this was either a “major” or “moderate” obstacle. While several of the obstacles elicited responses that were similar, some interesting variations did exist. For example, nearly 60% of Classic participants indicated that lack of administrative support was not an obstacle, while only 45.3% of Expansion participants reported this. In addition, 22.8% of Classic participants indicated that lack of flexible classroom time was not an obstacle, while 66.1% of Expansion respondents indicated this (see Table 4).

Feelings of preparedness and usefulness of training components

When asked how prepared participants felt to implement technology and related activities into their teaching after completing the training, slightly more Expansion participants indicated that they were “very well prepared” than did Classic participants. This difference persisted across five categories of preparedness. Slightly more Classic participants indicated that they were “moderately prepared” to engage in these activities than did Expansion participants across all categories (see Table 5). Similarly, when asked how useful a set of components was in helping teachers to integrate technology (Table 6), responses from Expansion participants were higher for almost all components in the category indicating the components were “very useful”. While Classic participants did indicate in large numbers that they also found the components to be “very useful”, their response percentages were lower than the Expansion participants. Both groups identified “discussing and thinking through the pedagogical topics” as the least useful component of the training, with 23.1% of Classic participants and 20.3% of Expansion participants indicating that this was either “not useful” or “somewhat useful”. Responses to this question for two components–creating student multimedia presentations and creating student publications–showed no statistically significant differences.

Responses to Master Teachers

Participants were also asked to rate their workshop leader in four areas of leadership (see Table 7). Again a greater percentage of Expansion participants (between 85.6% and 73.5%) rated their workshop leaders as “very successful” in all areas than did the Classic participants (between 82.8% and 67.6%).

TABLE 7: THINK ABOUT THE TRAINER WHO LED YOUR WORKSHOP AND HIS OR HER LEADERSHIP OF THE TRAINING AS A WHOLE. RATE YOUR OPINION ABOUT YOUR TRAINER IN THE AREAS LISTED BELOW (CLASSIC: N=49,329; EXPANSION: N=9,800)

CONCLUSION

While program evaluators have access to limited data about who the Expansion participants are demographically, it is clear that those teachers participating in the Expansion training report equal, or often times higher, levels of satisfaction with the Intel Teach to the Future training experience as teachers participating in the Classic training. The data indicate that Expansion teachers found the trainings to be focused on the central components of the Intel Teach to the Future curriculum, such as the integration of technology into curriculum, using technology effectively, and collaborating with others, and that they plan to use the information learned in the training in their classrooms. Expansion participants also reported higher levels of preparedness to implement technology-related activities in their classrooms, higher levels of usefulness for components of the training, and higher levels of success for their trainer in conveying aspects of the training during workshops and to individuals with questions or needs than did their Classic counterparts. Interestingly, however, one area showed substantial differences between the two groups of teachers. When reporting on obstacles to the integration of technology, 14.5% more Classic participants reported that lack of administrative support was not an obstacle than did Expansion participants, and 15.9% more Classic participants than Expansion participants stated that lack of instructional support was not an obstacle. This suggests that Classic participants are anticipating fewer logistical challenges to their future use of technology in their classrooms. Differences between items that were described as major obstacles were less substantial, though still evident in many of the categories listed.

It is striking that even without incentives available and with a much more loosely coupled accountability structure in place to guide implementation, Expansion participants’ responses to the program seem to be just as positive as that of Classic participants or, in some cases, even more positive. This finding is somewhat counterintuitive. While it is difficult to explain, given the lack of demographic information about the Expansion participants, some possible explanations are presented here.

First, the sample sizes of the two groups suggest one possible reason for the differences between participant responses. The Classic sample size is five times that of the Expansion sample. Generally, larger samples tend to produce less dramatic survey results. Highly negative and highly positive responses begin to balance each other out as the sample size increases, and large numbers of moderate responses will pull the overall results toward the middle. In addition, given the large discrepancy, the group of Expansion participants who completed the End of Training survey may be quite different from the Classic participants who completed the survey. If Expansion Master Teachers were less systematic than Classic Master Teachers about having all of their PTs complete the survey, then it may be reasonable to assume that those Expansion teachers who felt positively about the training would be more likely to complete the survey than those who did not.

Second, it is possible that the overall high levels of satisfaction regarding the training experience can be understood by examining the makeup of the Expansion Master Teacher group. As was
noted in our Classic and Expansion Master Teacher End of Training Survey Report, the data suggest that the Expansion group of Master Teachers includes far fewer classroom teachers than the Classic group, which is comprised almost entirely of classroom teachers. Those educators included in the Expansion Master Teacher group may be individuals with administrative or professional development responsibilities at either the school or district level, though this information is not provided in the survey data collected. If this is the case, these educators would have had previous training and experience with providing professional development to teachers on a regular basis, and this would offer an explanation for the Expansion participants' high level of satisfaction with their workshop leaders and with the presentation of workshop content.

Third, although the Expansion program does not provide direct incentives to participants, such as software and discounts on hardware, it is being offered at a time when many indirect incentives for participation in technology professional development are becoming part of the larger educational culture. As computer technology increasingly becomes integral to our society, more states and districts are demanding that teachers acquire technical skills in order to meet the instructional needs of students. Some states are now requiring that teachers illustrate technical competencies in order to maintain their accreditation. Even in those states that do not have specific accreditation requirements, teachers are facing increased accountability for meeting technology standards in their teaching. These conditions create strong incentives for teachers to seek out technology training, and for districts to provide that training. Therefore, it may not be accurate to conclude from these survey results that teachers do not need incentives to motivate them to take part in technology professional development, but that incentives can come from outside, as well as inside, the program.

In order to fully understand the results of these surveys and the comparisons between the results, more information needs to be gathered about both the Master and Participant teachers the Expansion program is reaching. However, this initial analysis reveals that the Expansion version of Intel Teach to the Future is maintaining the program's high standards for professional development by providing quality instruction and preparing teachers to take what they learn back to their classrooms.
